

Geyser is a grey water automatic pump developed to treat hot discharged water for housewares (dishwashers, washing machines, kitchens and bathrooms).

Geyser is different from standard macerators for its possibility to work with hot discharged water up to 100°C. Unlike the other macerators, its motor is placed outside the water tank. In this way it is not affected by temperature of the hot water.

Geyser has a powerful VORTEX pump able to discharge high volume of grey water, granting high performances in terms of flow and vertical lift.

The VORTEX pump has dedicated stainless steel knives to treat solid residual.
